What you can do here	3
Why use Capacity Forecasting	3

Capacity Forecaster predicts how transactions and capacity-affecting metrics will trend over time so you can plan infrastructure ahead of demand.

What you can do here

- **Trend analysis.** See month-by-month transaction growth at the cumulative and per-transaction level. Spot the workload mixes or clusters causing the most anomalies.
- **Trend forecast report.** Calculate the growth trend for transactions over a specific duration.
- **Custom growth plan.** Enter your own growth percentage on a transaction mix and get a detailed capacity forecast for every related metric.

Why use Capacity Forecasting

- **Match capacity to workload patterns.** Pinpoint the exact mix that drives the most resource contention (for example, high CPU plus high memory plus high I/O), and plan for the projected growth of that mix.
- **Lower data center cost.** Cut capacity-breach incidents and right-size services that are over-provisioned.
- **Get ahead of signals.** Forecast capacity early to plan infrastructure and configuration changes before they cause problems.
